

VITAL STATISTICS SUMMARY

BEXLEY CITY

May 2005

(Prepared by the Franklin County Board of Health for Bexley City Health Department)

I. BIRTH DATA FOR THE PERIOD 1990 TO 2002

The following tables describe recent data for birth for the City of Bexley and Franklin County. The birth statistics are given by total number of births, low birth weight newborns (≤ 2500 grams), and very low birth weight newborns (≤ 1500 grams – very low birth weight serves as an indicator of at-risk births). Rates are set at per 1,000 for live births, and per 100 for low and very low birth weights.**

** Note that the setting of new births for year 2001 used geographical information system (GIS) technology for residential assignment. Accordingly, the rate comparison is slightly different from prior estimates of population (estimated at 0.56% change from self-reported residential assignment).

II. 5 LEADING CAUSES OF DEATH FOR THE PERIOD 1997 TO 2002

The mortality statistics are given by the 5 leading causes of death per year for Franklin County. Causes of death are comparatively tracked to enable Health Department researchers to understand the fluctuation in the leading mortality factors between individual jurisdictions and the whole of Franklin County. Rates are set at per 100,000 population and are calculated as simple rates due to the small sample sizes (≤ 10) per cell for some of the causes.* Age-adjusted mortality statistics for the whole of Franklin County are available from the Health Department upon request.

* The number of cases from for the years 1997 and 1998 have been adjusted to account for new Federal Coding Schemes. Prior to the 1999 data, the Coding Scheme for mortality used ICD-9 Classifications for causes of Death. Starting in 1999, the Coding Scheme used for mortality is the ICD-10 Classifications. The data presented represents a conversion of the 1997 and 1998 classifications. A comparability ratio is used to adjust the tables.
